

Goalaxify Demo Video Script

Narrated by Kushi Numdin

Step 1 – Opening (≈40 seconds)

"Hi, I'm Kushi Numdin. This is Goalaxify, my entry for the TxODDS World Cup hackathon on Superteam Earn, Track 1: Prediction Markets & Settlement.

Goalaxify is a voice-native World Cup prediction app. Fans simply talk their bet, stake SOL on Solana, and get settlement backed by TxODDS TxLINE data. Our tagline is: Talk your bet.

Here's what I'll show you today:

- Voice prediction booth — stake by talking to a stadium announcer
- Solana wallet integration — Phantom and Solflare, fully on-chain stakes
- TxLINE live fixtures — real World Cup matches, odds, and kickoffs
- Live goal moments — follow the match as it happens
- Cancel and replace — manage open bets by voice before kickoff
- On-chain settlement — pool escrow, resolution, and claim winnings
- Profiles and bet history — wallet-linked identity and full bet trail
- Leaderboard — top winners and recent wins
- Ten languages — UI and voice booth controlled by one setting
- Progressive Web App — installable to your home screen

Let me walk you through the app."

Step 2 – Home (≈30 seconds)

"This is the Home screen. The hero introduces the app, and below you see upcoming World Cup matches pulled live from TxLINE — TxODDS's official feed. Real teams, real kickoff times, real odds. Nothing is hardcoded.

The bottom navigation takes you everywhere: Home, Booth, Live, Profile, Leaderboard, and Settings. The whole app is mobile-first, built for fans watching on their phones during the match."

Step 3 – The Booth (≈90 seconds)

"The Booth is where Goalaxify really stands out. No forms, no spreadsheets — you just talk your prediction.

First, I connect my Solana wallet. The booth needs it because every voice session is tied to your wallet address for staking and on-chain proof.

I pick a match, start the session, and the stadium announcer takes over. It asks who I'm backing — home, draw, or away — how much SOL I want to stake, and reads the bet back before I confirm.

I'll say: 'Home win. Half a SOL.' ...then 'Yes, confirm.'

Now I approve the wallet transaction... and here's the success screen with the outcome, stake, and estimated return.

Under the hood, Vapi runs the voice agent, Deepgram handles transcription, and my wallet signs the stake directly on Solana. The bet is saved with the transaction signature, so everything is fully auditable."

Step 4 – Live (≈30 seconds)

"Next is the Live tab. While a World Cup match is happening, this section shows goal moments, halftime, and full-time events for the current live fixture.

It connects your prediction to the real emotion of the game. You're not betting in a vacuum — you're right there with the match as it unfolds."

Step 5 – Profile (≈60 seconds)

"This is your Profile. It's completely wallet-gated — your Solana address is your identity.

In Details you can set a display name and avatar.

The Wallet tab shows your connected address and balance.

In the Bets tab, you can see every prediction you've made. Each card shows your pick, stake, estimated return, and current status.

Before kickoff, you get one manage action per bet. I tap Manage by voice and the booth reopens. I can cancel for a full refund or replace the bet — refunding the old stake and placing a new one in a single voice flow.

After a win, you simply hit Claim and receive your payout from the pool authority on Solana. The transaction signature serves as your receipt."

Step 6 – Leaderboard (≈25 seconds)

"Here's the Leaderboard. It ranks the top predictors by SOL won and shows a feed of recent wins.

This is real social proof that the settlement system actually pays out."

Step 7 – Settings & Language (≈40 seconds)

"In Settings, the key feature for this demo is Language.

Goalaxify supports ten languages: English, Spanish, French, Portuguese, German, Italian, Chinese, Japanese, Korean, and Arabic.

One setting controls both the entire app and the voice booth. Let me switch to Español... now the navigation and text are in Spanish. If I went back to the booth, the announcer would speak Spanish too.

Same wallet, same settlement, same data — just in the fan's preferred language. Perfect for a global World Cup audience."

Step 8 – PWA (≈20 seconds)

"Goalaxify is a Progressive Web App. You can install it directly to your home screen — it runs full-screen, standalone, with quick shortcuts to the Booth, Live, and Leaderboard. No app store required."

Step 9 – Closing (≈20 seconds)

"That's Goalaxify — voice predictions, real TxLINE data, live moments, on-chain staking and settlement, profiles, leaderboard, ten languages, and an installable PWA.

Built for the TxODDS World Cup hackathon on Superteam Earn.

Talk your bet.

Try it live at goalaxify.vercel.app. Thank you!"
